Subject:

sequence search on 09/051,034

Please search SEQ ID NOs:11, -12, and -13 of 09/051,034 against the commercial and interference databases using standard search parameters.

Please print results on laser printer and send to Peter Brunovskis, CM1-12E05. GAU 1632, 305-2471.

Thanks

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                     Score

This sequence represents isoform 4 of the porcine enzyme appliants. 3-galactosyl transferase (alpha-1,3-GT). The enzyme catalyses are attachment of a galactose sugar molecule on the N-acetyllactosamine molecule on the N-acetyllactosamine molecules are partly responsible for raising anti-graft antibodies, which like to graft tissue rejection. The invention relates to a method of thin thin ting the graft rejection mechanism by introducing the sequence encoding an antibody targeted to alpha-1,3-GT into the cells of animal, especially a pig, from whom organs may be used for xenotransplants. Neutralisation of the alpha-1,3-GT leads to tissues or organs lacking the galactose on the glycoproteins and glycolipids, thus preventing the diduction of the rejection response.

                                                                                                                                                                        The sequence is that of the product of the porcine Gal-alpha (1,3) galactosyl transferase gene which produces a Gal epitope on the surface of porcine cells. This epitope is recognised by antibodies which are responsible for hyperacute rejection of xenotransplanted pig cells, tissues and organs.

Co-transfection of these cells with vector pHT encoding human H-transferase (R90572) resulted in a reduction in levels of galactose alpha(1,3) galactose epitopes expressed by the coll of the colline of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the attachment of a galactose sugar molecule on the N-acetyllactosamine molecy found on surface glycoproteins and glycolipids. These sugar molecules are partly responsible for raising anti-graft antibodies, which lead to graft tissue rejection. The invention relates to a method of inhibiting the graft rejection mechanism by introducing the sequence encoding an antibody targeted to alpha-1,3-GT into the cells of animal, especially a pig, from whom organs may be used for xenotransplants. Neutralisation of the alpha-1,3-GT leads to tissues or organs lacking the galactose on the glycoproteins and glycolipids, thus preventing induction of the rejection response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Transgenic; swine; porcine; alpha (1,3) galactosyltransferase; antisense; ribozyme; Gal-alpha-1,3-Gal-beta-1-4GlcNAc; epitope terminal; xenogenic; transplant; rejection; gene therapy; pig.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim

                           moiety found on surface glycoproteins and glycolipids. These sugar molecules are partly responsible for raising anti-graft antibodies, where the sugar transfer is the sugar rejection. The invention relates to a method of inhibiting the graft rejection mechanism by introducing the sequence encoding an antibody targeted to alpha-1,3-GT into the cells of animal especially a pig, from whom organs may be used for xenotransplants. Neutralisation of the alpha-1,3-GT leads to tissues or organs lacking the galactose on the glycoproteins and glycolipids, thus preventing induction of the rejection response.
                                                                                                                                                             This sequence represents isoform 1 of the porcine enzyme alpha-1,3-galactosyl transferase (alpha-1,3-GT). The enzyme catalyses the attachment of a galactose sugar molecule on the N-acetyllactosamine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              encoding porcine alpha-1,3-GalT was generated from liver RNA primers based on conserved regions of the mouse and cattle alpha-GalT genes. Potential sites to interrupt the alpha-1,3-GalT gene homologous recombination) were identified in exons 4, 7, 8 and 9. Inactivation allows the breeding of 'knock-out' animals, e.g. suitable as donors of organs to overcome hyperacute rejection lems in human xenotransplantation.

                                                                          The present sequence is a secreted protein nt746_4, encoded by known colone nt746_4 (deposited as ATCC 98600) isolated from human adult brain CDNA library. Recombinant secreted proteins can be produced by transforming host cells and culturing them under suitable conditions. The polynucleotide and protein are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Some predicted biological activities include cytokine and cell proliferation/ or suppressing activity, haematopoless regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, activity, catherin/tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotide encoding secreted corrected protein can be used for gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The amino acid sequence of the marmoset alpha-1,3-galactosyltransferase. The enzyme can be used in methods of enhancing an immune response by associating the alpha-galactosyl epitope with a cell membrane or viral glycoprotein. The alpha-galactosyl epitope enhances phagocytosis and subsequent processing of the antigen. The method is useful in the treatment of tumours e.g. leukemia, lymphoma, myeloma, melanoma, carcinoma and sarcoma, or for the generation of viral vaccines by opsonising a viral glycoprotein. The alpha-galactosyl epitope enhances recognition of the antigen in an animal that synthesises the naturally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          alpha-galactosyl epitope; cell membrane; virus; phagocytosis; tumour; antigen processing; leukemia; lymphoma; melanoma; carcinoma; sarcoma; vaccine; opsonisation; glycoprotein; antibody; anti-Gal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   intracellular or secreted proteins or lipids. These can be used for the prodn. of diagnostics and therapeutics. There is a single transmembrane domain consisting of a 19 amino acid hydrophobic segment flanked by basic residues and a large (presumably catalytic) C-terminal domain that would ultimately be targeted to the Golgi. It has potential N-glycosylation sites indicating that as with other glycosyltransferases, it may be synthesised as a glycoprotein. It is representative of a Type II transmembrane protein. See also R13749-R13752.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The amino acid sequence codes for a protein capable of functioning as UDP- Gal: [beta-D-Gal(1.4)]-D-GlcNnc alpha (1.3)galacto-syltransferase. The products of this enzyme, sub-terminal alpha (1.3) and alpha(1.4) fucose residues are used in the post-
                                                                                    Gyycosyltransferase; fucosyltransferase; GDP-Fuc; in vitro; cell; surface; oligosaccharide.
                                                                                                                                                                         A glycosyltransferase

                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that of a human glycosyl transferase. The emay be non glycosylated. This prevents premature loss of en activity. It can also be used in in vitro reactions to modi surface oligosaccharide mols. e.g. blood group determinants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA fragment encoding a glycosyltransferase - can be used for in vitro reactions to modify cell surface oligosaccharide(s) e.g. blood gp. determinants, to protect against transplant rejection
            Example 2; Page 272-274; 329pp; English
                                  New recombinant fucosyltransferase proteins - useful for modifying cell surface oligosaccharide structures
                                                                                                                                                       08-SEP-1995;

It amino acid sequence was deduced from a CDNA clone (T61676) obtd. by transfecting COS-1 cells with cDNA derived from mouse F9 teratocarcinoma cells, and screening the transfected cells for surface-localised Gal(alpha1-3)Gal linkages. When expressed in animal cell lines, the enzyme provides specific capabilities with respect to post-translational modification of the oligosaccharides of expressed proteins or lipids. The enzyme can also be used to raise antibodies and to screen for inhibitor cpds.
                                                                                                                                          Black MT,

The DNA sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic
           This sequence represents a Streptococcus pneumoniae protein that, based on homology with a B. lichenformis protein, is a glutamyl endopeptidase precursor, and is encoded by a DNA sequence of the invention. The DNA sequences were isolated from Streptococcus pneumoniae strain 0100993 (NCIMB 40794). The Streptococcus pneumoniae proteins of the
                                                                                                                                    diagnosing 
infections

88888888888888888 inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic infimunnisation. They can also be used to induce an immunological response the anamal by inoculation with the S. pneumoniae proteins or delivery and/or T cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to bipock protein-mediated mammalian cell invasion, and to block the normal progression of pathogenesis in infections initiated other than by the implantation of in-dwelling devices or other surgical techniques.   Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

   Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score

-I- TISSUE SPECIFICITY: FOUND IN THE BASEMENT MEMBRANE OF ALL CONTRACTILE TISSUES. IT IS CONCENTRATED OVER MUSCLE DENSE BO AND M-LINES WHICH ARE ASSOCIATED WITH BETA-INTEGRIN.

-I- DEVELOPMENTAL STAGE: SYNTHESIZED EARLY IN EMBRYOGENESIS.
-I- SIMILARITY: CONTAINS 3 LDL-RECEPTOR CLASS A DOMAINS.
-I- SIMILARITY: CONTAINS 16 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAINS.
-I- SIMILARITY: CONTAINS 7 LAMININ EGF-LIKE DOMAINS.
-I- SIMILARITY: CONTAINS 2 LAMININ DOMAINS IV.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB seq
